

EVENT MANAGEMENT SYSTEM

Team A

Aadhil Nandan M, Akshay Kumar,
Aryan Doshi, Aryan Singh, Athulya R

Technologies Used

Python

Django

SQLite

Bootstrap 5

Smart Scheduling Track activities, conflict-free venue bookings & automated calendar updates.

Real-time Insights Monitor attendance, event performance metrics & beautiful analytical reports.

Robust Security Session-based authentication, user-role access controls & secure data logs.

Project Overview

A centralized web portal that digitizes the complete event lifecycle for institutions — replacing scattered spreadsheets and paper logs with one secure, structured system.

Why it was built

Manual coordination created data silos, scheduling conflicts, and reporting overhead.

Primary objective

One admin portal to manage categories, events, members, and inquiries end-to-end.

Target users

System administrators and event coordinators within an organization.

Core Workflow

Plan

Define categories & structure

Manage

Schedule events, register members

Report

Track completed activity & insights

Problem Statement

Manual event coordination creates operational friction across the board.

Traditional System

Manual Registration

Paper forms and disconnected Google Forms

Paper Records

Spreadsheets prone to loss and corruption

Scheduling Issues

Venue and resource booking conflicts

Communication Gaps

Updates shared via email & notice boards

Event Management System

Automated

Structured CRUD workflows for every entity

Centralized

One relational database for all event data

Secure

Session-based authentication & hashed credentials

Efficient

Real-time dashboard analytics on demand

Objectives

Centralized Event Management

Single source of truth for categories, events & members

Participant Registration

Register members with role and status tracking

Category Management

Organize events under logical, prioritized groupings

Reporting

Track completed events for post-event analysis

Secure Authentication

Session-based login with hashed credentials

Responsive Interface

Bootstrap 5 layout across desktop, tablet & mobile

Technology Stack

System Architecture

Response flows back up through the same layers to the browser.

MODEL – TEMPLATE – VIEW (MTV)

Database Design

Four relational entities connected through simple, cascading relationships.

Core Modules

Authentication

Category Management

Event Management

Member Management

Reports

Contact Management

Profile Management

Application Workflow

Key Features

Secure Login

Session-based authentication for admins

CRUD Operations

Create, read, update, delete everywhere

Participant Management

Roles, departments & status tracking

Responsive Design

Works across desktop, tablet & mobile

Dashboard Analytics

Live counts across all entities

Event Scheduling

Dates, venues, capacity & deadlines

Reports

Completed-event summaries on demand

Image Upload

Category & event banners via Pillow

Dashboard Showcase

Challenges & Learning

Learning Django MTV

Understanding the Model-Template-View request cycle

CRUD Implementation

Building consistent create/edit/delete flows

Bootstrap UI

Keeping form styling consistent with Crispy Forms

Professional Dev Workflow

Iterative prototyping using agile practices

Database Relationships

Designing cascading foreign keys across entities

Authentication

Supporting login via both username and email

Debugging

Tracing issues across views, forms & templates

Future Enhancements

Email Notifications

QR Code Check-in

Online Registration

Role-Based Access

REST API

Cloud Deployment

Analytics Dashboard

Mobile Application

Conclusion

The Event Management System successfully demonstrates a complete, functional full-stack solution — built as a strong foundation for future scale-up.

Full-Stack Development

Secure Authentication

Database Management

Event Scheduling
